

Slashless Slash Protector

Slash injuries caused by skates are common from junior ice hockey to professional matches. So far, there has been no way to keep protected from injuries to the back part of the leg.

The **Slashless** slash protection socks are a Finnish invention to prevent the occurrence of serious injuries in the area of the ankle, Achilles tendon and calf. The protector is designed as a slash protector for ice sportsmen on skates. The slash protector protects against slash injuries caused by the blades of skates. When properly worn, the slash protection sock will protect the back part of the leg against slashes. Sizes are available from **juniors to seniors**.

The **Slashless** slash protector is a new CE approved and patented ice hockey accessory, and the first one invented by a Finn.

Preventive

The skating sock coated with special elastic meshy material prevents the occurrence of serious Achilles tendon and muscular injuries in all skating sports.

Flexible

The elastic protective material bends with body movements without making it any more difficult to move or get dressed. The material is durable and endures repeated washing.

Discreet

The protector is made of translucent and inconspicuous material that does not hide the team colours or signs.

References

The slash protectors have been successfully tested by the Finnish national ice hockey team, the Kärpät league team as well as several junior teams, and the socks are being currently used by all the Oulun Kärpät juniors and the women's league team.
